

easYgen-3000 Series Genset Control

Operation

Software Version: 1.15xx or higher

WARNING

Read this entire manual and all other publications pertaining to the work to be performed before installing, operating, or servicing this equipment. Practice all plant and safety instructions and precautions. Failure to follow instructions can cause personal injury and/or property damage.

The engine, turbine, or other type of prime mover should be equipped with an overspeed (overtemperature, or overpressure, where applicable) shutdown device(s), that operates totally independently of the prime mover control device(s) to protect against runaway or damage to the engine, turbine, or other type of prime mover with possible personal injury or loss of life should the mechanical-hydraulic governor(s) or electric control(s), the actuator(s), fuel control(s), the driving mechanism(s), the linkage(s), or the controlled device(s) fail.

Any unauthorized modifications to or use of this equipment outside its specified mechanical, electrical, or other operating limits may cause personal injury and/or property damage, including damage to the equipment. Any such unauthorized modifications: (i) constitute "misuse" and/or "negligence" within the meaning of the product warranty thereby excluding warranty coverage for any resulting damage, and (ii) invalidate product certifications or listings.

CAUTION

To prevent damage to a control system that uses an alternator or battery-charging device, make sure the charging device is turned off before disconnecting the battery from the system.

Electronic controls contain static-sensitive parts. Observe the following precautions to prevent damage to these parts.

- Discharge body static before handling the control (with power to the control turned off, contact a
 grounded surface and maintain contact while handling the control).
- Avoid all plastic, vinyl, and Styrofoam (except antistatic versions) around printed circuit boards.
- Do not touch the components or conductors on a printed circuit board with your hands or with conductive devices.

OUT-OF-DATE PUBLICATION

This publication may have been revised or updated since this copy was produced. To verify that you have the latest revision, be sure to check the Woodward website:

http://www.woodward.com/pubs/current.pdf

The revision level is shown at the bottom of the front cover after the publication number. The latest version of most publications is available at:

http://www.woodward.com/publications

If your publication is not there, please contact your customer service representative to get the latest copy.

Important definitions

WARNING

Indicates a potentially hazardous situation that, if not avoided, could result in death or serious injury.

CAUTION

Indicates a potentially hazardous situation that, if not avoided, could result in damage to equipment.

NOTE

Provides other helpful information that does not fall under the warning or caution categories.

Woodward reserves the right to update any portion of this publication at any time. Information provided by Woodward is believed to be correct and reliable. However, Woodward assumes no responsibility unless otherwise expressly undertaken.

RP-3000 Remote Panel		37413	-

Table 1-1: Manual - Overview

Intended Use The unit must only be operated as described in this manual. The prerequisite for a proper and safe operation of the product is correct transportation, storage, and installation as well as careful operation and maintenance.

What are the differences between the easYgen-3000 Series Package P1 & Package P2?

easYgen-3000 Series	Package P1	Package P2		
Freely configurable PID controllers	-	3		
External discrete inputs / outputs via CANopen (maximum)	16 / 16	32 / 32		
External analog inputs / outputs via CANopen (maximum)	=	16 / 4		

NOTE

This manual has been developed for a unit equipped with all available options. Inputs/outputs, functions, configuration screens, and other details described which do not exist on your unit may be ignored.

The present manual has been prepared to enable the installation and commissioning of the unit. Because of the large variety of parameter settings, it is not possible to cover every combination. The manual is therefore only a guide. In case of incorrect entries or a total loss of functions, the default settings may be taken from the list of parameters in the configuration manual 37469 or from ToolKit and the respective *.SID file.

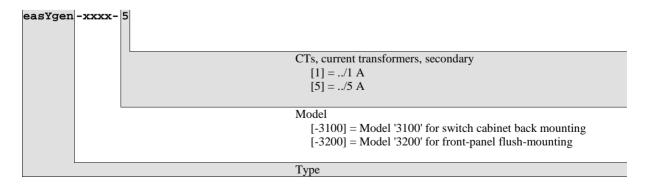

© Woodward Page 5/60

Short Description

The easYgen-3000 Series generator set controllers provide the following functions:

- Genset control
- Engine, mains and generator protection
- Engine data measurement -
 - oil pressure and temperature, coolant temperature, battery voltage, speed, service hours, etc.
- Generator and mains data measurement
 - o voltage, current, power, kvar, kW, kWh, etc.
- Load/var sharing for up to 32 participants
- Load-dependent start/stop
- Automatic, Manual, and Stop operating modes
- Application modes
 - o no CB operation
 - o open GCB
 - o open/close GCB
 - o open/close GCB/MCB
- LogicsManager for processing measured values, discrete inputs, and internal states
- Engine starter sequencing
- Alarm display with circuit breaker trip and engine shutdown
- AMF (automatic mains failure) standby genset control, with automatic engine start on a mains failure detection and open transition breaker control
- Critical mode operation
- Synchronizing (phase matching and slip frequency) and mains parallel operation
- External frequency, voltage, power, and power factor set point control via analog input or interface
- FIFO event history with 300 entries
- Multilingual user interface (English, German, French, Spanish, Italian, Portuguese, Turkish, Russian, Chinese, Japanese)
- ECU data visualization via J1939
- CAN bus communication to engine controllers, plant management systems, expansion boards, and ToolKit configuration and visualization software
- RS-485 Modbus communication with plant management systems
- RS-232 Modbus communication with plant management systems and ToolKit configuration and visualization software

Type designation is as follows:

Examples:

EASYGEN-3200-5 (easYgen-3200, 100 & 400 Vac inputs, ../5 A measuring inputs, front panel flush-mounting) EASYGEN-3100-1 (easYgen-3100, 100 & 400 Vac inputs, ../1 A measuring inputs, cabinet back mounting)

Page 6/60 © Woodward

Chapter 2. easYgen-3200 Navigation / Operation

Figure 2-1: Front panel and display

Figure 2-1 illustrates the front panel/display of the easYgen-3200 with push buttons, LEDs and Liquid Crystal display (LC display). A short description of the front panel is given below.

NOTE

This push button is always active and will stop the engine when pressed, except the operating modes are selected externally. In this case, the AUTO and MAN Mode push buttons are also disabled.

Function blocks

Buttons that have the same function within one screen are grouped into function blocks. The function blocks are defined as:

Display....... Change the method of voltage and power calculations displayed (page 29).

Mode..... Change the mode of operation (page 32).

Operation Used to perform manual operation of the genset and the breakers (page 33).

Navigation ... Navigation between system and configuration screens, and alarm list (page 33).

Push buttons

The push buttons on the front panel are assigned to softkeys on the display. Each softkey is assigned to a function depending on the mode of operation.

The display contains softkey characters, measuring values, modes of operation, and alarms. The functionality of the display screens as well as the description of the functions is detailed in the "Navigation" section (page 8).

13 (14) LED

The left LED ¹³ indicates that the unit is in STOP mode. The right LED ¹⁴ indicates that alarm messages are active / present in the control unit.

© Woodward Page 7/60

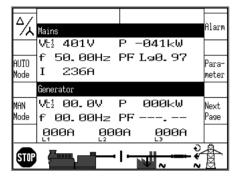

Navigation

Individual display screens are listed in the following text. All softkeys, which are available in the individual screens are described with their function.

Screen "Operating values - overview" / "Starting screen"

[all application modes]

STOP operating mode:

This screen appears upon startup of the unit.

Toggle between delta/wye voltage display. The index of the "V" symbol indicates whether delta or wye voltage is displayed and which phases are displayed.

Change into AUTOMATIC operating mode.

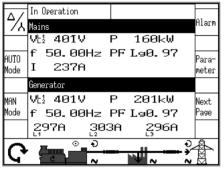

Change into MANUAL operating mode.

Change into STOP operating mode.

AUTOMATIC operating mode:

Display the alarm list (unacknowledged alarms).

Display the configuration menu screen.

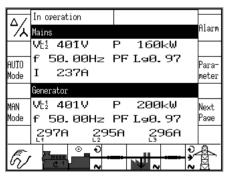

Display the indication menu screen.

This softkey is only displayed in front of the mains symbol if the Alarm LED is flashing (An alarm is present, which has not yet been acknowledged as 'Seen'). This softkey re-

sets the horn and acknowledges the alarm as 'Seen'.

Operating mode MANUAL: start/stop engine.

Operating mode MANUAL: open GCB/MCB.

Operating mode MANUAL: close GCB/MCB.

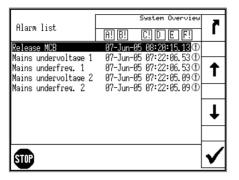

NOTE

If the mains data display is disabled (refer to Configuration Manual 37469), above screens will only show generator data with bigger digits.

Page 8/60 © Woodward

Screen "Alarm list"

[all application modes]

This screen appears after pressing the "Alarm" softkey in the starting screen. All alarm messages, which have not been acknowledged and cleared, are displayed. Each alarm is displayed with the alarm message and the date and time of the alarm occurred in the format yy-mon-dd hh:mm:ss.ss. Please note, that self-acknowledging alarm messages get a new timestamp when initializing the unit (switching on). The ① symbol indicates that this alarm condition is still present. A maximum of 16 alarm messages can be displayed. If 16 alarm messages are already displayed and further alarm messages occur, these will not be displayed before displayed alarm messages are acknowledged and thus deleted from the list. The "!" following the letter symbols A through E indicate whether an alarm class is present 🖭 or not 🖸

۲

Return to the starting screen.

Scroll up to next alarm message.

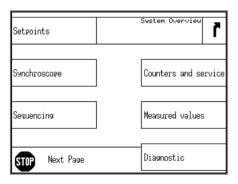

Scroll down to next alarm message.

The selected alarm message (displayed inverted) will be acknowledged. This is only possible, if the alarm condition is no longer present. If the Alarm LED is still flashing (an alarm is present, which has not yet been acknowledged as 'Seen'), this softkey resets the horn and acknowledges the alarm as 'Seen'.

Screen "Next Page"

[all application modes]

This screen appears after pressing the "Next Page" softkey.

7

Return to the starting screen.

Setpoints

Display the setpoints screen.

Synchroscope

Display the synchroscope screen.

Sequencing

Display the sequencing screen.

Counters and service

Display the counters and service screen.

Measured values

Display the measured values screen.

Diagnostic

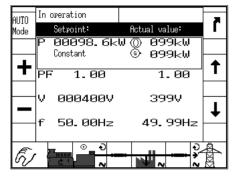

Display the diagonstic screen.

© Woodward Page 9/60

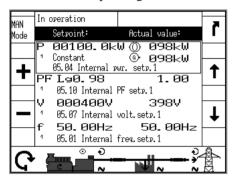

Screen "Setpoints"

[all application modes]

MANUAL operating mode:

AUTOMATIC operating mode:

This screen appears after pressing the "Setpoints" softkey in the "Next page" screen. The set point is displayed on the left and the actual value is displayed on the right half of the screen. The symbol ① indicates the mains power and ③ indicates the generator power. The figures 1 or 2 indicate whether set point 1 or set point 2 is used in AUTOMATIC operation. The source, which is used for set point 1 or set point 2, is displayed with the respective <code>LogicsManager</code> function number.

The set points may only be adjusted if the respective controller is enabled. Frequency and voltage may be adjusted within the configured operating limits. Active power may be adjusted between 0 and the configured load control setpoint maximum. The power factor may be adjusted between 0.71 leading and 0.71 lagging.

Return to "Next page" screen.

Change into AUTOMATIC operating mode.

Change into MANUAL operating mode.

Scroll up one set point.

Scroll down one set point.

Mode

Mode

Raise the selected set point.

Lower the selected set point.

PReal power

Constant = fixed generator load control

Import = fixed import power control

Export = fixed export power control

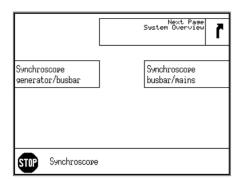

PF.....Power factor **V**......Voltage

fFrequency

Page 10/60 © Woodward

Screen "Synchroscope"

[all application modes]

This screen appears after pressing the "Synchroscope" softkey in the "Next page" screen.

7

Return to "Next page" screen.

Synchroscope generator/busbar

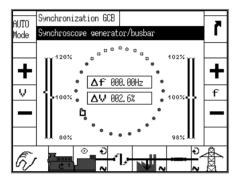

Display the generator / busbar synchroscope screen.

Synchroscope busbar/mains

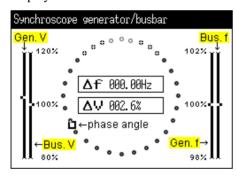

Display the busbar / mains synchroscope screen.

Screen "Synchroscope generator / busbar"

[all application modes]

Display detail:

This screen appears after pressing the "Synchroscope Gen. / Busbar" softkey in the "Synchroscope" screen. The square symbol □ indicates the actual phase angle between busbar and generator. The 12 o'clock position on the top means 0° and the 6 o'clock position on the bottom means 180°. The frequency and voltage differences are indicated in the center of the circle.

7

Return to "Synchroscope" screen.

AUTO Mode Change into AUTOMATIC operating mode.

MAN Mode Change into MANUAL operating mode.

STOP

Change into STOP operating mode.

Operating mode MANUAL: Raise voltage/frequency.

Operating mode MANUAL: Lower voltage/frequency.

Operating mode MANUAL: start/stop engine.

Operating mode MANUAL: open GCB/MCB.

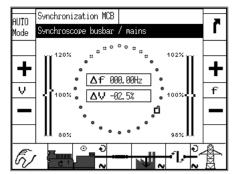

Operating mode MANUAL: close GCB/MCB.

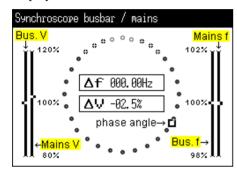

© Woodward Page 11/60

Screen "Synchroscope busbar / mains"

[all application modes]

Display detail:

This screen appears after pressing the "Synchroscope Busbar / Mains" softkey in the "Synchroscope" screen. The square symbol \square indicates the actual phase angle between busbar and mains. The 12 o'clock position on the top means 0° and the 6 o'clock position on the bottom means 180° . The frequency and voltage differences are indicated in the center of the circle.

Return to "Synchroscope" screen.

Change into AUTOMATIC operating mode.

Change into MANUAL operating mode.

Change into STOP operating mode.

Operating mode MANUAL: Raise voltage/frequency.

Operating mode MANUAL: Lower voltage/frequency.

Operating mode MANUAL: start/stop engine.

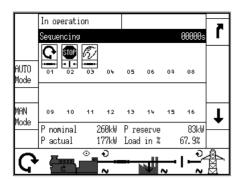

Operating mode MANUAL: open GCB/MCB.

Operating mode MANUAL: close GCB/MCB.

Page 12/60 © Woodward

Screen "Sequencing"

[all application modes]

This screen appears after pressing the "Sequencing" softkey in the "Next page" screen. The sequencing screen shows all gensets participating in load sharing. The operation mode of each genset as well as the state of its GCB is shown on this screen. The symbol above the generator number indicates AUTOMATIC operating mode, indicates MANUAL, and indicates STOP. The field below shows whether the respective GCB is closed () or open (). The bottom field displays the actual load sharing values. If this device is not participating in load sharing, "LD start stop Off" is displayed here.

Return to "Next page" screen.

Scroll down to genset 17 through 32 display.

Scroll up to genset 1 through 16 display.

Ochange into AUTOMATIC operating mode.

MAN Change into MANUAL operating mode.

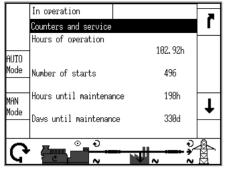

Change into STOP operating mode.

Operation

The display is partitioned into different areas to give an overview of the displayed data.

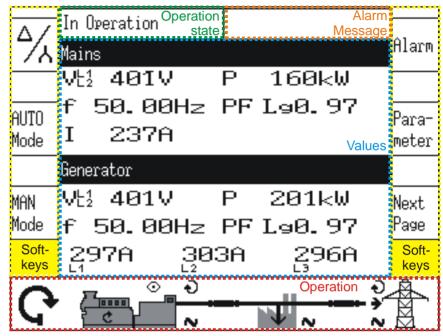

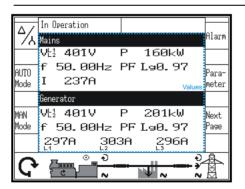

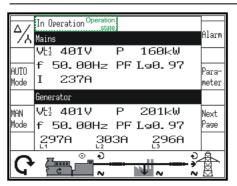

Figure 2-2: Screen - Level overview

"Values"

The "values" section of the screen illustrates all measured power related information including voltages, currents, frequencies, power, and power factor values.

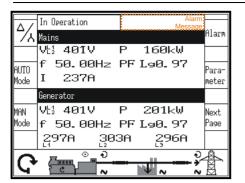

"Operation state"

The "operation state" section of the screen shows the actual operating information. Refer to Appendix A: Status Messages on page 49 for a list of all operation states.

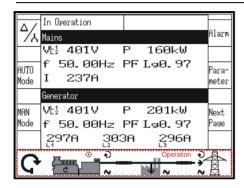

© Woodward Page 29/60

"Alarm Message"

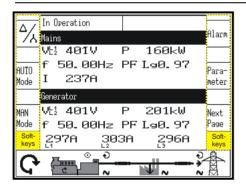

The "alarm message" section of the screen shows the last alarm message that is occurred and not yet acknowledged. Refer to Appendix A: Alarm Messages on page 52 for a list of all alarm messages.

"Operation"

The "operation" section of the screen has a single-line diagram of the system application showing current status of the engine and power circuit breakers. This level is also used for manual operation of the genset.

"Softkeys"

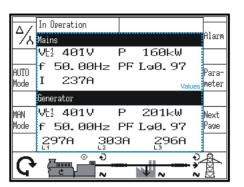

The softkey characters permit navigation between screens, levels and functions as well as configuration and operation.

Page 30/60 © Woodward

Display

Softkey "Voltage display"

The voltage display softkey changes the type of voltage display. The amount of information available from the system depends on how the measuring is configured in the control. Table 2-1 illustrates what values are available depending on the configured measurement type.

Measuring point		l display	Symbol of' the displayed voltage		Displayed at parameter setting			
	Soft key	Press	the displayed	voitage	3Ph 4W	3Ph 3W	1Ph 2W	ng 1Ph 3W

Mode

Softkeys "Mode"

By pressing the softkeys "AUTO Mode", "MAN Mode" or "STOP", the operating mode is selected. Depending on the application mode selected, different softkeys are enabled or disabled in the display. The active operation mode is displayed left of the engine symbol. If the operation mode STOP is selected, the LED next to the push button is illuminated in addition to the mode being displayed left of the engine symbol.

Note: If the control unit has been configured for external operating mode selection, the AUTO and MAN Mode softkeys are not displayed and the STOP push button is disabled. The operating mode cannot be changed.

STOP Operating mode

When STOP is selected, the engine is stopped. The STOP mode is indicated in the lower left corner of the display by the symbol.

AUTOMATIC Operating mode

When AUTOMATIC is selected, the control unit manages all engine start/stop and breaker control functions. These functions are performed in accordance with how the control is configured. The AUTOMATIC mode is indicated in the lower left corner of the display by the \square symbol.

MANUAL Operating mode

When MANUAL is selected, all engine and breaker control is performed manually via the softkeys along the bottom of the display. The MANUAL mode is indicated in the lower left corner of the display by the symbol.

Page 32/60 © Woodward

Operation

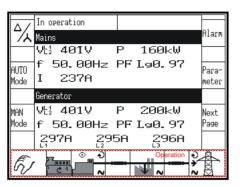

If the unit is in the MANUAL operating mode (the symbol is displayed in the lower left corner), the softkeys are enabled for manual operation of the engine and the power circuit breakers. The symbols "0" and "1" indicate if a start/stop command is being processed at the moment. The arrows on the breaker symbol indicate if an open/close command is being processed at the moment. The symbol indicates that the engine delayed monitoring has expired and the monitoring functions are enabled. The **N** symbol indicates that power is detected at the respective measuring point (generator, busbar, or mains). The direction of the circular arrow indicates, if the generator or mains rotating field is clockwise **(CW)** or counter-clockwise **G** (CCW). The arrow symbol at the mains interchange point indicates whether power is exported (*) or imported (*).

Engine Start/Stop

Starting process: By pressing this softkey the engine is started.

- Successful: If the starting process was successful, the circular arrow 🖒 indicates that speed is detected and the engine is running. The eve symbol indicates that the engine delayed monitoring has expired and the monitoring functions are enabled.
- Unsuccessful: No change in the display until the start failure message appears.

Stop process: Pressing the softkey again will stop the engine.

- Successful: If the stop process was successful, the circular arrow and the eve symbol disappear.
- Unsuccessful: No change in the display until the stop failure message appears.

Power circuit breaker open/close (GCB/MCB)

<u>Close:</u> By pressing the softkey under the desired circuit breaker, it is closed.

- Successful: If the closing process was successful, the breaker symbol turns horizontal.
- Unsuccessful: If the closing process was not successful, the breaker symbol remains vertical.

Open: To open this breaker this softkey is pressed while the breaker symbol is horizontal. The arrows and the "Open GCB/MCB" messages indicate the open command.

- Successful: If the opening process was successful, the breaker symbol turns vertical.
- Unsuccessful: If the opening process was not successful, the breaker symbol remains horizontal and the arrows will remain within the softkey character until the control is able to open the breaker.

CAUTION

The breakers will open immediately without power reduction. If you want to open the breaker in a noload condition, you must reduce the load manually in the set point screen.

© Woodward Page 33/60

LogicsManager

Some parameters of the easYgen are configured via the *LogicsManager* (refer to Configuration Manual 37469). A typical *LogicsManager* screen is shown in the following. You may configure a logical operation using various command variables, signs, logical operators, and delay times to achieve the desired logical output.

7

LogicsManager Screen

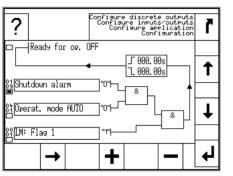

For configuration of the *LogicsManager* the softkeys displayed in the right and bottom section are used. The softkey on the upper left opens a help screen. The softkeys are assigned with different functions.

Two delays may also be configured for the output:

☐ (Delay ON): delay before output becomes TRUE ☐ (Delay OFF): delay before output becomes FALSE The squares below each command variable number indicate the actual state of this command variable:

: the command variable is TRUE

: the command variable is FALSE

The actual state of the *LogicsManager* output is indicated by the square in the upper left corner.

Leave current screen ("Escape" / "ESC")

By pressing this softkey character you exit and go to the previous screen. If the Escape key is used to leave a *LogicsManager* configuration screen, any unconfirmed changes made will not be stored.

Select parameter

By pressing these softkey characters you may select the *LogicsManager* parameter to be configured upwards or downwards.

Confirm selection

By pressing this softkey character you confirm the configured option of the selected *LogicsManager* parameter.

Change option

By pressing these softkey characters you may change the option of the selected *Logics-Manager* parameter upwards or downwards.

Change variable group/cursor position

Command variable selection field:

By pressing this softkey character you may change the command variable group. The command variables within a group may be changed using the \blacksquare and \blacksquare softkeys. Time delay configuration field:

By pressing this softkey character you may change the cursor position. The selected digit may be changed using the \blacksquare and \blacksquare softkeys.

Page 34/60 © Woodward

Help button

By pressing this softkey character you get to a help screen, which displays the logical operators of the *LogicsManager*. You may return to the *LogicsManager* with the Escape softkey .

© Woodward Page 35/60

Chapter 3. easYgen-3100 LEDs

The easYgen-3100 unit with metal housing and without display and buttons features two LEDs on the front plate. The two LEDs have the following functionality:

COMMS LED

- o NOT illuminated: no data is received by any interface
- Blinking green: data is received by any interface, the blinking rate increases with the load on the interfaces until it is:
- o Illuminated green: increased data traffic is received by any interface
- o Illuminated **red**: the number of participants on the load share bus does not match with the configura-
- o Illuminated **red**/**green** (appears as **orange**): the number of participants on the load share bus does not match with the configuration and data is received by any interface

RUN LED

- o NOT illuminated: the unit is not ready for operation
- o Illuminated green: the unit is ready for operation and no alarm is present
- o Blinking green/red: the unit is ready for operation, but a warning alarm (alarm class A or B) is present
- o Illuminated **red**: the unit is ready for operation, but a shutdown alarm (alarm class C, D, E or F) is present
- Blinking red: the unit is ready for operation, but a shutdown and a warning alarm is present

NOTE

Definition: An alarm is "present" means that the alarm is active or latched (triggered).

Figure 3-1 indicates the position of the LEDs on the front plate of the easYgen-3100 unit.

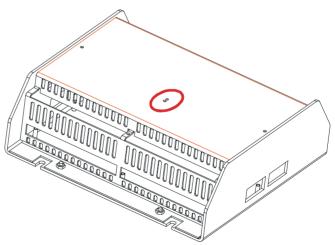

Figure 3-1: Position of the LEDs

Page 36/60 © Woodward

Chapter 4. Functional Description

NOTE

This functional description of the easYgen refers to both versions, the easYgen-3100 and the easYgen-3200. However, every information concerning display, push buttons (softkeys), and MANUAL operation mode refers to the easYgen-3200 only.

Overview

	Application Mode							
	{0}		{10}		{1oc}		{2oc}	
Operation Mode	MAN	AUTO	MAN	AUTO	MAN	AUTO	MAN	AUTO

Table 4-1: Functional description - Overview

- Application Mode (page 38): depends on the application; defines the number/function of the breakers ({0}, {10}, {10c}, {20c}).
- Operating Mode (page 39): depends on the application; separates between STOP, MANUAL and AUTOMATIC.

© Woodward Page 37/60

Application Modes

The application mode may be changed only during configuration with the code level CL2 or higher password. The most important features of the four application modes are illustrated in the following section. A description of the functions that are possible during each application mode can be found in the Configuration Manual (parameter 3401, manual 37469). Table 4-1: Functional description - Overview describes which function is available in each application mode.

Application Mode {0} - Start/Stop

This application mode provides the following functions:

Measuring of engine/generator parameters (i.e. voltage, frequency, current, power, coolant temperature, oil pressure, etc.)

Application Mode (10) - Open GCB

This application mode provides the following functions:

- Measuring of engine/generator parameters (i.e. voltage, frequency, current, power, coolant temperature, oil pressure, etc.)
- Engine start/stop
- Engine/generator protection (relay output to open GCB)
- Mains failure detection

Application Mode (1oc) - Open/Close GCB

This application mode provides the following functions:

- Measuring of engine/generator parameters (i.e. voltage, frequency, current, power, coolant temperature, oil pressure, etc.)
- Engine start/stop
- Engine/generator protection (relay output to open GCB)
- GCB operation (relay output to close GCB)
- Mains failure detection

Application Mode (2oc) - Open/Close GCB/MCB

This application mode provides the following functions:

- Measuring of engine/generator parameters (i.e. voltage, frequency, current, power, coolant temperature, oil pressure, etc.)
- Engine start/stop
- Engine/generator protection (relay output to open GCB)
- GCB operation (relay output to close GCB)
- MCB operation (relay output to open and close the MCB)
- Mains failure detection (AMF auto mains failure operation) and automatic engine start/stop

Page 38/60 © Woodward

Operating Modes

Operating Mode STOP

NOTE

Selecting the operating mode STOP is not the same as an EMERGENCY STOP. In some cases the easygen will perform additional logic functions, such as an engine cool down period, before the engine is stopped. It is recommended that an EMERGENCY STOP discrete input be utilized and programmed as an F class alarm.

In the STOP operating mode neither the engine nor the GCB can be operated. Dependent on the application mode the power circuit breakers cannot be operated. If the operating mode STOP has been selected while

the engine was already stopped

- The GCB will not be closed
- The fuel solenoid relay will not be enabled
- The discrete inputs and CAN bus commands are ignored
- The start push buttons (softkeys) are disabled (depending on the previous operating mode)
- The engine/generator monitoring remains de-activated (exception: all monitoring that is not delayed by the engine speed monitoring)

the engine was running

The GCB is opened

Requirements:

- The easYgen is at least in application mode {10} and
- the GCB is closed
- The MCB will be closed

Requirements:

- The easYgen is at least in application mode {2oc}
- the GCB is open
- the MCB is enabled
- An engine cool down will be performed (the STOP LED is flashing)
- The fuel solenoid relay will be disabled
- The engine/generator monitoring will be de-activated (exception: all monitoring that is delayed by the engine speed monitoring)
- The control unit screen will display the operations as they are performed

the engine performs a cool down

Pressing the STOP button again causes an immediate stop of the cool down and stops the engine

NOTE

If the conditions of the *LogicsManager* function "Enable MCB" (parameter 12923) are TRUE, the MCB will be closed again if it is open in STOP operating mode.

© Woodward Page 39/60

Operating Mode MANUAL

In the MANUAL operating mode (softkey "Mode MAN") the engine and the power circuit breakers are operated via the push buttons along the bottom of the display (softkeys). All elements that may be operated via the softkeys have a black frame. All other elements cannot be operated. The single line diagram in the lowest line will change according to the application mode.

The single line diagrams are displayed as follows:

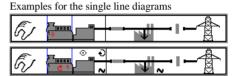

Single line diagram for application mode $\{0\}$.

When MANUAL operating mode is selected a black frame softkey character will appear around the engine to indicate that the push buttons below this softkey character may be used to start and stop the engine. This is shown below highlighted for the following functions.

Start the engine

Stop the engine

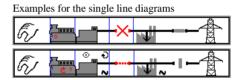

Single line diagram for application mode {10}.

For a {10} application both the engine and the GCB softkey characters appear with the following functions. The "X" symbol indicates that a breaker open command is issued or a closure of the breaker is blocked. The dotted breaker line indicates no defined breaker state.

- Start the engine
- Stop the engine
- Open the GCB

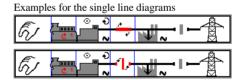

Single line diagram for application mode {1oc}.

For a {1oc} application both the engine and the GCB softkey characters appear with the following functions.

- Start the engine
- Stop the engine
- Open the GCB
- Close the GCB

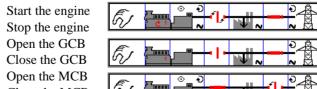

Single line diagram for application mode {2oc}.

For a {2oc} application both the engine, the GCB and the MCB softkey characters appear with the following functions.

Examples for the single line diagrams

- Close the MCB

Page 40/60 © Woodward

Operating Mode AUTOMATIC

In the AUTOMATIC operating mode, all engine, GCB, and/or MCB functions are operated via an interface, or automatically by the control unit (i.e. a mains failure). The function of the easYgen depends on the configuration of the unit and how the external signals are used. The start/stop sequence of the engine is described in more detail in manual 37469.

In the following text the main functions are briefly described.

Start engine

Remote start

The engine is started via a remote start signal.

A Start in Auto requires.

- The AUTOMATIC operating mode is enabled.
- The function "Start req. in AUTO" is assigned via the *LogicsManager* to a discrete input and the conditions are fulfilled (TRUE).
- This discrete input or a start via interface is energized (logically HIGH signal) or the necessary command of the interface protocol is set (for explanation of the interface protocol refer to the interface manual 37472).
- A class C alarm or higher is not present (for explanation of the alarm classes refer to manual 37469).
- The engine is ready for operation.
- The GCB is open.

Mains fault

AMF / Auto mains failure operation (only in application mode {2oc}) If the AUTOMATIC operating mode is enabled and the application mode is configured to {2oc} (2-breaker logic) and the mains fail, the engine and the power circuit breakers will be operated according to the conditions in the following table.

An AMF start requires.

- The AUTOMATIC operating mode is enabled.
- The application mode is configured as {2oc}.
- The parameter "Emergency power" is configured as ON.
- The configured mains failure limits are reached.
- The configured delay times have expired.
- A class C alarm or higher is not present (for explanation of the alarm classes refer to 37469).
- The engine is ready for operation.

Status (prior to mains failure)			Action (order)			
Engine	GCB	MCB	Engine	GCB	MCB	
0 () 1)	0 (open)	0 (open)	1 (start)	2 (close)		
0 (stopped)	0 (open)	1 (closed)	1 (start)	3 (close)	2 (open)	
1 (running)	0 (open)	0 (open)		1 (close)		
	0 (open)	1 (closed)		2 (close)	1 (open)	
	1 (closed)	0 (open)				
	1 (1 1)	1 (1 1)		1 (open)	271	
	1 (closed)	1 (closed)		3 (close)	2 (close)	
	1 (closed)	1 (closed)		(remains closed)	1 (open)	

Mains decoupling GCB:

Mains decoupling MCB:

Table 4-2: Functional description - AMF conditions

© Woodward Page 41/60

Functional description of AMF conditions:

- If the engine is not running prior to a mains failure and both, the GCB and MCB are open, the following actions occur:
 - 1. The engine starts
 - 2. The GCB closes
 - 3. The load is supplied by the generator set
- If the engine is not running prior to a mains failure, the GCB is open, and the MCB is closed the following actions occur:
 - 1. The engine starts
 - 2. The MCB opens
 - 3. The GCB closes
 - 4. The load is supplied by the generator set
- If the engine is running prior to a mains failure, the GCB is open, and the MCB is open the following actions occur:
 - 1. The GCB closes
 - 2. The load is supplied by the generator set
- If the engine is running prior to a mains failure, the GCB is open, and the MCB is closed the following actions occur:
 - 1. The MCB opens
 - 2. The GCB closes
 - 3. The load is supplied by the generator set
- If the engine is running prior to a mains failure, the GCB is closed, and the MCB is open the following actions occur:
 - 1. The generator set continues to supply the load
 - If the genset is operating in parallel with the mains prior to a mains failure, both breakers are closed, the following actions occur:
 - 1. A mains decoupling will be performed and the GCB or MCB will be opened depending on the configuration of the mains decoupling function:
 - Mains decoupling configured to MCB or MCB->GCB:
 - a. The MCB opens
 - b. The GCB remains closed
 - c. The engine keeps running
 - Mains decoupling configured to GCB or GCB->MCB:
 - a. The GCB opens
 - b. The MCB opens after the delay time
 - c. The GCB closes
 - d. The engine keeps running
 - 2. The load is supplied by the generator set

Page 42/60 © Woodward

Chapter 5. easYgen-3200 Configuration

This chapter provides information "how to configure the unit via the LC display" as well as the description of all parameters that may be changed without a password. If you have the correct codes to configure the unit (this is verified via passwords), refer to manual 37469 for a description of all parameters, their setting range, and their influence to the operation of the unit.

Structure of the Parameters

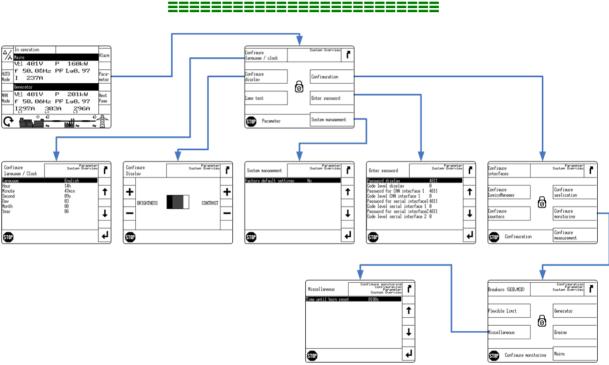

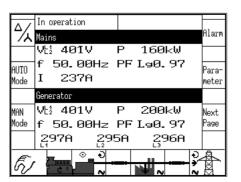

Figure 5-1: Configuration screens (overview)

Parameter

Access configuration menus

By pressing the softkey, the Parameter menu will be displayed to permit configuration of the control unit.

The different configuration screens may be displayed by selecting the respective softkey. Refer to Figure 5-1 for a structure of the configuration screens.

Appendix A. Display Messages

Status Messages

AUTO mode ready Automatic mode ready for start ID 13253 The unit is waiting for a start signal in Automatic operating mode and no alarm of class C, D, E, or	r F is
ID 13253 The unit is waiting for a start signal in Automatic operating mode and no alarm of class C, D, E, or	r F is
ID 13253 The unit is waiting for a start signal in Automatic operating mode and no alarm of class C, D, E, or	r F is
present.	
Aux. serv. postrun Postrun of the auxiliary operation is active	
ID 13201 After the engine has stopped, auxiliary operations are enabled. These operations ensure that require	
equipment which is necessary for the operation of the engine continues to run (i.e. electric cooling	fan).
Aux. services prerun Prerun of the auxiliary operation is active	
Before the engine is started the signal "aux. services prerun" is enabled, so that all required equipment which is necessary for the operation of the engine can be initialized, started or switched.	nent
Cool down Coasting of the engine is active	
ID 13204 The no load operation is performed prior to the stopping of the engine. The no load operation is ut	ilized to
cool the engine.	
Crank protect Starter protection	
ID 13214 To prevent the starter from being damaged by an engine that is rotating, a crank protection delay in the starter from being damaged by an engine that is rotating, a crank protection delay in the starter from being damaged by an engine that is rotating, a crank protection delay in the starter from being damaged by an engine that is rotating, a crank protection delay in the starter from being damaged by an engine that is rotating, a crank protection delay in the starter from being damaged by an engine that is rotating, a crank protection delay in the starter from being damaged by an engine that is rotating, a crank protection delay in the starter from being damaged by an engine that is rotating, a crank protection delay in the starter from being damaged by an engine that is rotating, a crank protection delay in the starter from being damaged by an engine that is rotating as the starter from being damaged by an engine that is rotating as the starter from being damaged by an engine that is rotating as the starter from being damaged by an engine that it is rotating as the starter from being damaged by an engine that is rotating as the starter from being damaged by an engine that is rotating as the starter from being damaged by an engine that is rotating as the starter from being damaged by an engine that is rotating as the starter from being damaged by an engine that is rotating as the starter from being damaged by an engine that is rotating as the starter from being damaged by an engine that is rotating as the starter from being damaged by an engine that is rotating as the starter from being damaged by an engine that is rotating as the starter from being damaged by an engine that is rotating as the starter from being damaged by an engine that is rotating as the starter from being damaged by an engine that is rotating as the starter from being damaged by an engine that is rotating as the starter from being damaged by an engine that is rotating as the starter from being damaged by an engine that the starte	s active
to ensure that the engine has time to stop rotating. Critical mode (Sprinkler operation) is active	
Critical mode Critical mode (Sprinkler operation) is active ID 13202 The sprinkler operation is activated. The exact description of the conditions and effects of the sprinkler operation.	mlrlan
operation are described in the configuration manual 37469.	likier
Emergency/Critical Emergency operation during active critical operation {2oc}	
ID 13215 Critical operation is activated.	
Emergency run Emergency power operation {20c}	
ID 13211 After the control unit detects that a mains fault has occurred, the engine is started after the emerge	ncv de-
lay timer expires. The MCB is opened, the GCB is closed, and the generator set assumes the load.	
generator set is already running, operations continue until the emergency power operation condition	ons no
longer exist. If the mains return, the mains settling timer becomes active first (see below).	
GCB dead bus close Dead bus closing of the GCB {1oc}, {2oc}	
ID 13209 The GCB is closed onto the de-energized busbar. The measured busbar voltage is below the config	gured
dead bus detection limit.	
GCB -> MCB Delay GCB - MCB delay time is active {20c}	
ID 13261 If the breaker logic is configured to Open Transition and a transfer from generator to mains supply	
itiated, the transfer time delay will start after the replay "GCB is open" is received. The MCB clos mand will be issued after the transfer time has expired.	e com-
GCB open The GCB is being opened {10c}, {20c}	
ID 13255 A GCB open command has been issued.	
Gen. stable time Generator stable time is active	
ID 13250 If the engine monitoring delay timer has expired, the generator settling time starts. This permits for	ranad-
ditional delay time before the breaker is closed in order to ensure that none of the engine delayed	
dogs trips.	
Idle run active The control is in idle mode	
ID 13216 No undervoltage, underfrequency, and underspeed monitoring is performed in idle mode. The flex	ible
limits 33 through 40 are not monitored.

Message text and ID	Meaning

Ignition	Enable the ignition {Gas engine}
ID 13213	After the purging operation and before the fuel solenoid is opened.
In operation	The genset is in regular operation
ID 13251	The genset is in regular operation and is ready for supplying load.
Loading Generator	The generator power will be increased to the set point
ID 13258	The generator power will be increased to the configured set point with a rate defined by the power con-
	trol set point ramp.
Mains settling	Mains settling time is active {2oc}
ID 13205	When the control unit detects that the mains fault is no longer present and power has been restored, the
	mains settling timer begins counting down. If the mains are stable after the expiration of the timer (the
	mains voltage has not fallen below or risen over the configured monitoring limits), the load is transferred from the generator supply to the mains supply.
MCB dead bus close	Dead bus closing of the MCB {20c}
ID 13210	The MCB is closed onto the de-energized busbar. The measured busbar voltage is below the configured
10 13210	dead bus detection limit.
MCB -> GCB Delay	MCB – GCB delay time is active {20c}
ID 13262	If the breaker logic is configured to Open Transition and a transfer from mains to generator supply is in-
	itiated, the transfer time delay will start after the reply "MCB is open" is received. The GCB close com-
	mand will be issued after the transfer time has expired.
MCB open	The MCB is being opened {2oc}
ID 13257	An MCB open command has been issued.
Power limited prerun	Active power limited prerun is active
ID 13252	The real power set point is limited to the warm up power limit for the configured warm up time.
Preglow	Preglow of the engine is active {Diesel engine}
ID 13208	The diesel engine is preheated prior to starting.
Ramp to rated	Engine is accelerating to rated speed
ID 13254	After firing speed has been exceeded, the engine monitoring delay timer starts. This message is displayed
	during this period.
Start	Start engine is active
ID 13206	After the "Prerun auxiliary operation" expires, the engine is started according to the configured start logic
	(Diesel or gas engine). When the start sequence is active, various relays are enabled and representative
Start - Pause	signals are passed via the CAN bus to a secondary engine control.
ID 13207	Start pause while starting the engine is active If the engine could not be started, the controller will pause for the configured time prior to attempting to
10 13207	issuing a start command again.
Start w/o Load	Start without load is active
ID 13263	A regular engine start is performed. The GCB operation is blocked to prevent a change from mains to
	generator supply.
Stop engine	Engine will be stopped
ID 13203	The engine will be stopped. The engine stop delay will be started when ignition speed has been fallen be-
	low. A restart is only possible if the engine stop delay has been expired.
Synchronization GCB	The GCB will be synchronized
ID 13259	The control tries to synchronize the GCB.
Synchronization MCB	The MCB will be synchronized
ID 13260	The control tries to synchronize the MCB.
Turning	Purging operation is active {Gas engine}
ID 13212	Before the fuel solenoid opens and the ignition of the gas engine is energized the remaining fuel, that
	may be present in the combustion chamber, will be removed by a purging operation. The starter turns the
	engine without enabling the ignition for a specified time to complete the purging operation. After the
Unloading Generator	purging process, the ignition is energized. The generator power will be decreased
ID 13256	The generator power will be decreased The generator power will be decreased after a stop command has been issued with a rate defined by the
10 13230	power control set point ramp before the GCB will be opened.
Unloading mains	The mains power will be decreased
ID 13264	The real power set point is increased with the configured rate after synchronizing the generator in inter-
	change transition mode. After the mains have been unloaded, the MCB will be opened.
Synch. PERMISSIVE	Synchronization mode PERMISSIVE
ID 13265	If the synchronization mode is set to "PERMISSIVE" [Parameter ID 5728] the screen message "Synch.
	PERMISSIVE" is blinking on the main screen.
Synch. CHECK	Synchronization mode CHECK
ID 13266	If the synchronization mode is set to "CHECK" [Parameter ID 5728] the screen message "Synch.
G	CHECK" is blinking on the main screen.
Synch. OFF	Synchronization mode OFF If the synchronization mode is set to "OFF" [Parameter ID 5738] the sensor message "Synch OFF" is
ID 13267	If the synchronization mode is set to "OFF" [Parameter ID 5728] the screen message "Synch. OFF" is blinking on the main screen.
Add-on delay	
ID 13274	Load dependent start/stop (LDSS) add-on delay time Shows the current state of LDSS in the sequencing screen. A countdown of the configured add-on delay
132/4	shows the current state of LDSs in the sequencing screen. A countdown of the configured add-on delay

Page 50/60 © Woodward

	time will be displayed.
Add-off delay	Load dependent start/stop (LDSS) add-off delay time
ID 13275	Shows the current state of LDSS in the sequencing screen. A countdown of the configured add-off delay
	time will be displayed.
Minimum run time	Load dependent start/stop (LDSS) minimum run time
ID 13276	Shows the current state of LDSS in the sequencing screen. A countdown of the configured minimum run
	time will be displayed.

Alarm Messages

NOTE

Refer to the Configure Monitoring section of the Parameters chapter in the Configuration Manual 37469 for a detailed description of the monitoring functions, which trigger the alarm messages.

Message text and ID	Meaning	
Amber warning lamp	Amber warning lamp, J1939 interface	
ID 15126	This watchdogs monitors, whether a specific alarm bit is received from the CAN J1939 interface. This	
	enables to configure the control in a way that a reaction is caused by this bit (e.g. warning, shutdown).	
	No alarm can be indicated if the CAN communication fails.	
Bat. overvoltage 1	Battery overvoltage, limit value 1	
ID 10007	The battery voltage has exceeded the limit value 1 for battery overvoltage for at least the configured	
	time and did not fall below the value of the hysteresis.	
Bat. overvoltage 2	Battery overvoltage, limit value 2	
ID 10008	The battery voltage has exceeded the limit value 2 for battery overvoltage for at least the configured	
	time and did not fall below the value of the hysteresis.	
Bat. undervoltage 1	Battery undervoltage, limit value 1	
ID 10005	The battery voltage has fallen below the limit value 1 for battery undervoltage for at least the configured	
	time and has not exceeded the value of the hysteresis.	
Bat. undervoltage 2	Battery undervoltage, limit value 2	
ID 10006	The battery voltage has fallen below the limit value 2 for battery undervoltage for at least the configured	
	time and has not exceeded the value of the hysteresis.	
CAN bus overload	CAN bus overload alarm	
ID 10089	The sum of CAN bus messages on al can buses together exceeds 32 messages per 20 ms.	
CAN fault J1939	Interface alarm J1939	
ID 10017	The communication with the ECU via the CAN bus interface has been interrupted and no data can be	
	transmitted or received over the bus within the configured time.	
CANopen Interface 1	Interface alarm CANopen on CAN bus 1	
ID 10087		
CANopen Interface 2		
ID 10088		
Charge alt. low volt		
ID 4056	The charging alternator voltage has fallen below the critical limit for at least the configured time and has	
	not exceeded the value of the hysteresis (the critical limit is 9 V for 12 V systems and 20 V for 24 V sys-	
	tems).	
Eng. stop malfunct.	Stop alarm of the engine	
ID 2504		
	countdown. If speed is still detected when this timer expires the controller recognizes an unsuccessful	
	stop of the engine. An unsuccessful stop of the engine is determined if speed (measured by the generator frequency, the MPU, or the <i>LogicsManager</i> "ignition speed") is detected within the configured time after	
	the stop signal has been issued.	
EEPROM failure	The EEPROM checksum is corrupted	
ID 1714		
GCB fail to close	1	
ID 2603	The easYgen has attempted to close the GCB the configured maximum number of attempts and failed.	
TD 2603	Depending on the configuration, the eas Ygen will continue to attempt to close the GCB as long as the	
	conditions for closing the GCB are fulfilled.	
GCB fail to open		
ID 2604	<u> </u>	
GCB syn. timeout	GCB synchronization time exceeded	
ID 3064	The easYgen has failed to synchronize the GCB within the configured synchronization time.	
ID 3064	The east gen has raned to synchronize the OCB within the configured synchronization time.

Gen.underfrequency 1	Generator underfrequency, limit value 1		
ID 1962	The generator frequency has fallen below the limit value 1 for generator underfrequency for at least		
	the configured time and has not exceeded the value of the hysteresis. Additionally, the alarm has not		
	been acknowledged (unless the "Self acknowledgement" is configured YES).		
Gen.underfrequency 2	Generator underfrequency, limit value 2		
ID 1963	The generator frequency has fallen below the limit value 2 for generator underfrequency for at least		
	the configured time and has not exceeded the value of the hysteresis.		
Gen. undervoltage 1	Generator undervoltage, limit value 1		
ID 2062	The generator voltage has fallen below the limit value 1 for generator undervoltage for at least the		
Gan undaminalhana 2	configured time and has not exceeded the value of the hysteresis.		
Gen. undervoltage 2	Generator undervoltage, limit value 2		
ID 2063	The generator voltage has fallen below the limit value 2 for generator undervoltage for at least the configured time and has not exceeded the value of the hysteresis.		
Gen unloading fault	Č		
	Generator unloading mismatch		
ID 3124	The easYgen failed to reduce the generator power below the configured unload limit within the configured time.		
Gen. volt. asymmetry	Voltage asymmetry		
ID 3907	The generator phase-to-phase voltages have higher differences between each other than the confi-		
15 3507	gured limit value.		
Ground fault 1	Generator ground current, limit value 1		
ID 3263	The measured or calculated ground current has exceeded the limit value 1 for the generator ground		
	current for at least the configured time and did not fall below the value of the hysteresis.		
Ground fault 2	Generator ground current, limit value 2		
ID 3264	The measured or calculated ground current has exceeded the limit value 2 for the generator ground		
	current for at least the configured time and did not fall below the value of the hysteresis.		
Inv. time overcurr.	Generator inverse time-overcurrent		
ID 4038	Current monitoring with tripping time depending on the measured current. The higher the current is		
	the faster the tripping time according to a defined curve. According to IEC 255 three different cha-		
	racteristics are available: normal, highly, and extremely inverse.		
Mains decoupling	Mains decoupling is initiated		
ID 3114	One or more monitoring function(s) considered for the mains decoupling functionality has triggered.		
Mains export power 1	Mains export power, limit value 1		
ID 3241	The mains export power has exceeded or fallen below the limit value 1 for mains export power for at		
W-1	least the configured time and did not fall below or exceed the value of the hysteresis.		
Mains export power 2	Mains export power, limit value 2		
ID 3242	The mains export power has exceeded or fallen below the limit value 2 for mains export power for at least the configured time and did not fall below or exceed the value of the hysteresis.		
Mains import power 1	·		
ID 3217	Mains import power, limit value 1 The mains import power has exceeded or fallen below the limit value 1 for mains import power for		
10 3217	at least the configured time and did not fall below or exceed the value of the hysteresis.		
Mains import power 2	Mains import power, limit value 2		
ID 3218	The mains import power, mine value 2 The mains import power has exceeded or fallen below the limit value 2 for mains import power for		
]	at least the configured time and did not fall below or exceed the value of the hysteresis.		
Mains overfreq. 1	Mains overfrequency, limit value 1

Message text and ID	Meaning
---------------------	---------

Damamatan alianmant	TD00
Parameter alignment	LDSS parameter mismatch detected
ID 4073	The easYgen has detected that not all LDSS parameters are configured identically at all
	participating units. Refer to the "Multi-unit configuration check" section in the "Parameters" chapter of the Configuration Manual 37469 for a list of all monitored parameters.
Ph.rotation mismatch	
ID 2944	Generator/busbar/mains phase rotation different
ID 2944	Generator, busbar (easYgen-3400/3500 only), and mains have different rotating fields. A CB closure is blocked.
Red stop lamp	The phase rotation monitoring is always enabled and cannot be disabled.
	Red stop lamp, J1939 interface
ID 15125	This watchdog monitors, whether a specific alarm bit is received from the CAN J1939 in-
	terface. This enables to configure the control in a way that a reaction is caused by this bit
Chood/from migrotab	(e.g. warning, shutdown). No alarm can be indicated if the CAN communication fails.
Speed/freq. mismatch	Difference in frequency/speed measurement alarm
ID 2457	The speed differential between the generator frequency (ascertained by the generator vol-
	tage measurement) and the engine speed (measured by the MPU) has exceeded the confi- gured limit value / differential frequency for at least the configured time and has not fallen
	below the value of the hysteresis. The alarm may also be triggered if the <i>LogicsManager</i>
	"ignition speed" is enabled and no electrical frequency is detected as well as the other way
	round.
Start fail	Failure of engine to start alarm
ID 3325	The generator set has failed to start after the configured number of attempts. Depending on
10 3323	the configuration, no more start attempt will be carried out until the alarm is acknowledged.
Unbalanced load 1	Generator unbalanced load, limit value 1
ID 2412	The generator current has exceeded the limit value 1 for generator unbalanced load for at
	least the configured time and did not fall below the value of the hysteresis.
Unbalanced load 2	Generator unbalanced load, limit value 2
ID 2413	The generator current has exceeded the limit value 2 for generator unbalanced load for at
	least the configured time and did not fall below the value of the hysteresis.
Underspeed 1	Engine underspeed, limit value 1
ID 2162	The engine speed has fallen below the limit value 1 for engine underspeed and has not ex-
	ceeded the value of the hysteresis.
Underspeed 2	Engine underspeed, limit value 2
ID 2163	The engine speed has fallen below the limit value 2 for engine underspeed and has not ex-
	ceeded the value of the hysteresis.
Unintended stop	Unintended Stop
ID 2652	The easYgen expects the generator to be running but a sudden underrun of the ignition
	speed has been detected.
Wb: Analog input x	Analog input {x}, wire break
refer to: Table 5-1 and	During measurement of the analog input a wire break was detected. This text may be as-
Table 5-2 on page 58	signed customer defined. The text in angular brackets is the default text.
Discrete input x	Discrete input {x}, energized / de-energized
refer to:	The actual state of the monitored discrete input is energized / de-energized (depending on
Table 5-3 on page 58	the configuration) for at least the configured time. This text may be assigned customer de-
Table 3-3 on page 30	fined. The text in angular brackets is the default text.
Ext. Discrete input x	External discrete input {x}, energized / de-energized
refer to:	The actual state of the monitored external discrete input is energized / de-energized (de-
Table 5-4 on page 58	pending on the configuration) for at least the configured time. This text may be assigned
	customer defined. The text in angular brackets is the default text.
-Flexible limit x	Flexible threshold {x}, overrun / underrun
refer to:	The actual value of the monitored analog value has exceeded / fallen below the threshold
Table 5-4 on page 58	(depending on the configuration) for at least the configured time and did not fall below /
	exceed the value of the hysteresis. This text may be assigned customer defined. The text in
	angular brackets is the default text.

Appendix B. Restoring a Language Setting

Due to the multilingual capability of the unit, it may happen that the display language of the easYgen-3200 is set to a language, the operator is unable to read or understand, by mistake. In this case, the following proceeding helps to restore the desired language. The default setting is English.

Figure 5-2: Front panel and display

Figure 5-2 refers to the different softkeys, which appear in the configured language. In order to change the language setting, press the softkeys in the following order:

- 1. Press softkey ⁵ until you return to the starting screen (as indicated above)
- 2. Press softkey 6 once to access the "Parameter" screen
- 3. Press softkey 1 once to access the "Configure language / clock" screen
- 4. Press softkey 8 once to edit the language setting
- 5. Press softkeys or to select the desired language
- 6. Press softkey 8 once to commit the language setting

Now, the display language is restored to the desired language again.
